

For high standards and aesthetics: floor coatings from Silikal

In hotels, restaurants, kitchens and in food processing, the demands on floors are divers. With its flooring systems based on methyl methacrylate (MMA), the German company Silikal offers individual solutions that are convincing in terms of function, appearance and durability.

The expectations of a reliable floor are as divers and demanding as the services in hotels, kitchens and food establishments. In kitchens, storage areas and in representative rooms such as lobbies, restaurants and bars, Silikal's reactive resin flooring systems have been a proven solution for decades. Silikal MMA floorings are also ideal for floors in food processing plants, e.g. in refrigerated and deep-freeze warehouses. The managing director of Silikal GmbH, Henning Simon, says: "Our Silikal flooring systems meet the needs for hygiene and safety. Supplemented by the important requirement for quick installation, we offer an extremely practical solution here with Silikal MMA floorings: our MMA floors are characterised by their quick processing, and are also extremely resilient, visually convincing and extraordinarily durable."

With hygiene and safety

Silikal flooring systems are designed for heavy-duty use: Wherever things get really busy, where something sometimes falls on the floor, where boxes are dragged across the floor and where cleaning agents are constantly used, the use of Silikal floor coatings has proven its worth. The reactive resins are resistant to many alkalis, salts, oils, fruit acids and greases. The seamlessly closed surface of the floors can be finished off with coving. Also important: the floors can be cleaned easily and quickly. Individually adjustable anti-slip classes ensure slip resistance.

With speed

A practical advantage with which the Silikal MMA flooring systems score is their quick installation. Installation or renovation can be carried out overnight - without costly interruption of operations. In just one to two hours after applying the last layer, the Silikal resins are cured and the floor is fully loadable. In practice, the installation is completed in just a few steps: Usually, the installers grind or blast the old floor. Then a Silikal primer is applied, followed by the main coat and then the top coat.

With colour and style

The Silikal floorings bring colour into everyday life. Almost every colour wish of the customers can be realised. By adding pigments, quartz or coloured flakes, there are countless possibilities for a colourful design. Silikal "Concrete Look" is particularly suitable for design floors in restaurants, bars and retail rooms. The look of this floor is reminiscent of concrete and gives interiors a fresh and modern atmosphere. The smooth floor designed in noble grey stands for clarity and style.

With tests

MMA flooring systems - like almost all Silikal products - are regularly inspected and evaluated by independent testing bodies. Proof and certificates, e.g. from HACCP International and the recommendation of the Bundesverband der Lebensmittelkontrolleure Deutschland e. V. (Federal Association of Food Inspectors in Germany), demonstrate the suitability of MMA reactive resin floors for handling food.

In addition to MMA-based floor coatings, Silikal GmbH, based in Germany, also develops and produces solutions for floors and building protection based on epoxy and polyurethane. Silikal - already on the market for 70 years - is now active in over 60 countries worldwide and maintains sales offices and warehouses in Switzerland, Korea, United Arab Emirates, Malaysia, Thailand, Indonesia, Australia and Turkey.
